SHIFA HOSPITAL

Appointment App

Mobile Programming • Week 6 Project Proposal

Project focus
Help patients find available time slots and book an appointment with a specific doctor.

Proposed product
A mobile app prototype with doctor search, available slots, booking details, and confirmation.

Team name: Team 6

Team members

Ahmed Tamer • Lana Mohamed • Abdelrahman Wael • Mohamed Ayman • Hala Hassan

Customer interview status: To be completed and verified by the team.

1. Customer Discovery

The assignment requires a real customer, evidence of the problem, and a short interview or meeting summary.

Proposed organisation: Shifa Hospital (confirm the actual customer contact with the team).

Business context: A hospital provides appointments with doctors across different specialties. Patients may need to identify a specific doctor and find a suitable available time.

Initial problem hypothesis: Patients may find it difficult to know which time slots are available for a particular doctor and complete the booking process without extra calls or visits.

Potential users: Patients and caregivers; authorised hospital staff who maintain doctor schedules.

Customer discovery status: Interview/meeting has not yet been confirmed. The problem above is a hypothesis for validation, not a verified statement from the hospital.

Questions to ask the customer

• How do patients currently book appointments with a specific doctor?

• How do patients learn which dates and time slots are available?

• What is the most difficult part of the current booking process?

• Who updates doctor availability, and how often does it change?

• What information should patients see before confirming a booking?

• Would the hospital be willing to review a student prototype?

After the interview, add: date, role of the person interviewed, key answers, and permission to identify the organisation or contact. Do not include personal contact details without permission.

2. Three App Ideas and Selection

Idea	Purpose	Main users	Why / trade-off
A — Doctor Appointment Booking	Help patients search for a doctor, view available slots, and book a visit.	Patients; authorised scheduling staff	Directly addresses the proposed booking problem and is achievable as a limited prototype.
B — Hospital Staff Management	Organise staff shifts, assign tasks, and manage team schedules.	Hospital managers and staff	Focuses on internal workforce operations, not patient appointments.
C — Hospital Inventory Management	Track medical supplies and equipment, stock levels, and items that need restocking.	Inventory staff and managers	Focuses on supplies and stock control, not appointment booking.

Selected idea: Idea A — Shifa Hospital Appointment App

Idea A has a clear user goal and a simple journey: find a doctor, view available times, select a slot, and receive confirmation. It can be demonstrated using sample data without connecting to live hospital systems.

The selection remains provisional until customer discovery confirms this is a real priority for the organisation.

3. Proposed Application

App name: Shifa Hospital Appointment App

Target users

• Patients who want to book an appointment with a specific doctor.

• Caregivers booking on behalf of a patient.

• Authorised hospital staff who manage or review doctor availability (staff tools may be outside the first prototype).

Problem

Patients need a simple way to find a specific doctor and understand which appointment times are available before booking.

Proposed solution

A mobile application that lets users search by doctor name or specialty, view a doctor profile and available slots, select a time, enter booking details, and see a confirmation screen.

Project scope

The first version will be a student prototype using sample doctor schedules and booking data. Real hospital integration, live schedule synchronisation, payments, and sensitive medical records are not included unless the hospital approves and provides access.

Expected value

The app aims to make appointment information easier to understand and reduce confusion during booking. These benefits should be tested with users.

4. Features: MVP vs Nice to Have

Must have (MVP)	Nice to have (future version)
Search doctors by name or specialty	Filters for location, language, or consultation type
View doctor profile and specialty	Ratings or patient feedback, if approved and appropriate
Show available dates and time slots from sample data	Live integration with hospital scheduling systems
Select a slot and enter basic booking details	Appointment rescheduling and cancellation
Confirm booking and show appointment reference	Push notifications or SMS reminders
Basic input validation and clear error messages	Accessibility and additional language options

Privacy and safety: Use fictional/sample patient data for demonstrations. Collect only the minimum information needed for the prototype, and do not store real patient medical records.

5. Main User Journey

Primary scenario: a patient wants to book an appointment with a specific doctor.

Step	User action and app response
1. Open app	Patient opens Shifa and chooses to continue or sign in.
2. Search	Patient enters a doctor’s name or chooses a specialty.
3. Review doctor	Patient checks the doctor’s name, specialty, and available dates.
4. Select slot	Patient selects a date and an available time.
5. Enter details	Patient reviews the booking and enters the required information.
6. Confirm	App validates the information and confirms the selected slot.
7. View confirmation	Patient sees the doctor, date, time, and booking reference.

Important rule: Check a slot again before final confirmation to reduce the risk of double booking. In the prototype, this can be simulated with sample data.

6. Screen Designs and Navigation

These mock-ups are illustrative, use sample data, and are not connected to hospital systems.

- **Welcome / Login:** entry point for the patient.
- **Home / Doctor Search:** search by doctor name or specialty.
- **Departments:** browse specialties to find a doctor.
- **Select Doctor:** choose a doctor from results.
- **Doctor Profile & Slots:** review details and choose a time.
- **Booking Details:** review the selected slot and enter basic details.
- **Confirmation:** display the appointment reference, doctor, date, and time.

Navigation flow: Welcome → Home/Search → Doctor Profile & Slots → Booking Details → Confirmation.

7. Development Plan, Risks, and Next Steps

Phase	Tasks	Output
1. Discover	Contact a real hospital representative; interview them; confirm the problem and requirements.	Customer evidence and refined scope
2. Design	Prepare wireframes; review the booking journey; revise screens using feedback.	Screen flow
3. Prototype	Build core screens with sample doctor and slot data; implement validation and confirmation.	Working demonstration
4. Test	Ask users to complete the booking task; record confusion and errors.	Feedback and improvements

Main risks and mitigations

• **Outdated availability:** use sample data for the student prototype and define who would update real schedules.

• **Double booking:** re-check slot status before confirmation.

• **Privacy:** use fictional data and collect only necessary details.

• **Integration limits:** do not connect to hospital systems without explicit approval and authorised access.

Immediate next steps

• Confirm the real customer/contact and obtain permission to describe the organisation.

• Complete the customer interview and replace assumptions with actual findings.

• Add each member’s student ID.

• Review the PDF against the final prototype and presentation before submission.

Submission reminder: This PDF contains customer discovery, three ideas and the selected proposal, prioritised features, user journey, and screen mock-ups. Submit the separate PowerPoint/PDF presentation as required.
